Multi-Factor Authentication (MFA)
Use Cases | EMA

EMA supports multi-factor authentication (MFA) using industry standards in alignment with the Office of the National Coordinator for Health IT's (ONC) Multi-factor authentication criterion at 45 C.F.R. §170.315(d)(13) for web browser user login and EPCS.

For login, the application provides an MFA solution that requires using a third-party application, such as Google Authenticator. There are no additional fees for this feature.

For EPCS, we use the supported MFA through our 3rd-party integration with ID.me.
