gGastro Patient Export Specifications

Version: **6.1.6.20230822**

Introduction

The purpose of this specifications document is to describe the content of the package provided as part of the EHI Patient Export output.

This document has been divided in five (5) distinctive parts:

- **CSV Files Dictionary**
Describing the content of each CSV file included in the package, down to the field position and name, type of field, maximum length, format, translation table and comments.
- **Data Schema**
Provides a tree like view of the relation between each CSV file needed to properly reconstruct the records along with the name of the field that links them.
- **Translations**
Some specific fields are provided with a code that represents a pre-defined item from a value set. This section contains the translation tables to retrieve the human readable value for each code.
- **Patient Documents**
Which describes how to relate the CSV files with their corresponding historical documents.
- **Glossary**
List of terms and their definitions.

Patient Documents

The patient documents are included as part of the package provided along with the discrete data described in the [Data Schema](#) chapter.

This is the list of document types and how to create a physical pointer to the target file.

Some of the pointers will use a reference to a specific **Table** and **Field** concatenation, while others will be based on an specific folder structure and derived date for the record with an specific date format, or a combination of both.

Below the list of document types:

- **Service Documents**

Encounters performed within the practice will generate a set of service documents, described in the tables with the same name: **Service Document** and **Service Document Version**.

In order to create the pointer concatenate using the following rules:

If the specific service document HAS A VERSION recorded in the **Service Document Version** table related by the **ServiceDocumentId**, then take the record marked by the field **Current = 1** and assuming **DATE = ServiceDocumentVersion.Date**:

`Documents\FORMAT[DATE, YYYY]\Service\FORMAT[DATE, YYYYMMDD]\ServiceDocumentVersion.SnapshotFileName`

If the specific service document DOES NOT HAVE A VERSION recorded in the **Service Document Version** table, then take:

ServiceDocument.SnapshotFileName
but remove the GUID that precedes it.

Example:

`Documents\2023\Service\20230315\c21e5818-2aa8-4440-a714-8a46603472b8.mht`

- **Imaging Documents**

Corresponds to Inbound Faxes, Scanned Documents, Imported Documents, Lab Results (with an external document received) and others, as listed in the [Imaging Document Source Type](#) translation, easily determined by the document **Source** field in the record.

In order to create the pointer concatenate the following values:

ImagingDocument.Folder + ImagingDocumentPage.FileName

Example:

`Documents\2023\Scanned\20230315\34d95407-7412-4641-8786-b7e67d1d5681.jpg`

- **Portal Documents**

The practice sends specific documents to the patient portal access point as per their designated workflows and compliance regulations.

The full pointer can be found at:

PatientPortalDocument.FilePath

Example:

`Documents\2023\Statement\20170903\63363178-7693-4f13-888e-ac4b4e05048e.pdf`

- **Letters**

These are document letters generated by the workflow for Recalls or any other type of business correspondence.

The pointer can be concatenated assuming **DATE = LetterQueue.Date**:

`\Documents\FORMAT[DATE, YYYY]\Letters\FORMAT[DATE, YYYYMMDD]\[LetterQueueFile.Id].mht`

Example:

`Documents\2023\Letters\20170903\b0ec1df0-3f3b-4937-a272-1626be67e55c.mht`
